BST Adjustable Longline Oyster System - Layout Diagram

Diagram not to scale. 132 line posts per system (4 lines each with 33 posts per 105m with a 3m gap between posts. 3 oyster bags between all posts). Line spacing between each double is 700mm and the space between the 2 doubles is 600mm.

This is a Cross Line System used as an alternative to the standard system and can be used without any modifications.

A view of the risers showing the height adjustability of the line.

Oyster Supplies Pty Ltd

It has taken years of research and development for BST Oyster Supplies to develop "The Adjustable Longline Oyster Farming System".

"The Adjustable Longline Oyster Farming System" lets you manage your oysters more efficiently and economically than traditional methods and is a lot simpler to erect, with lower maintenance costs and higher yields.

Using the best quality products available, the system was developed by three oyster growers at Cowell, South Australia to suit the rough and weedy conditions in Franklin Harbour.

The success of the longline system lies in the ability to raise and lower the height of the oyster bags on the line, thereby giving the oyster farmer a management technique to control shell growth, meat condition, cleaning and ruffling. This system is a vast advantage over fixed timber racking where the oysters are at the mercy of the elements.

"The Adjustable Longline Oyster Farming System" has received world wide recognition.

BST Oyster Supplies have also developed and marketed an innovative range of products that suit "The Adjustable Longline Oyster Farming System".
